P8106 Midterm Report

Group 2: Kate Colvin (KAC2301), Jeong Yun (Lizy) Choi (JC6452), and

Introduction

In this project, our team explored the dataset collected from a study on evaluating antibody

responses to a newly authorized vaccine. The primary outcome of interest is the log-transformed

antibody level measured via dried blood spots. The dataset includes a range of demographic and

clinical predictors such as age, gender, race/ethnicity, smoking status, BMI, chronic conditions, and

time since vaccination.

Our goal is to develop a predictive model that characterizes how these factors influence antibody

responses and asses how well this model generalizes to a new independent dataset collected at a

later time point. By doing so, we hope to identify key predictors of antibody levels and evaluate the

robustness/generalizability of our model across different dataset.
